

Logic Pro – Power Tips (0004)

Mike Cullen www.83db.com

The Hidden Automation Folder

- 1) Create a short cut **key command** for **Automation Event Edit** (I use **ctrl+command+E**)
 - 2) Create a short cut **key command** for **Delete Unused Tracks** (I use **ctrl+T**)
 - 3) Select any region that contains **Track Automation Data**
 - 4) Open the Automation Event Edit List using the command you have set up in **step 1**.
 - 5) With the Automation Event Edit list open: **Open a new Arrange Window** by pressing Command + 1
 - 6) Inside of this newly opened Arrange Window you will see a region on one track. The Track name defaults to the one that you selected in the original Arrange Window.
 - 7) Activate your **Delete Unused Tracks** key command. All other tracks are erased leaving just the one track that contains a **Folder** for all your Automation data.
 - 8) You are now free to cut (with the Scissor Tool) and **move Region Blocks of automation data** just as you would other events such as Notes.
- Note: DO NOT TRY TO REPEAT SELECTED FOLDER PARTS. YOU WILL GET AN ERROR MESSAGE.**
- 9) After cutting and moving blocks of Folder Automation data, return to the original arrange window to view results.
